

The M15c biological microscope is a versatile instrument, suitable in its simplest form for schools or, with the extensive range and interchangeability of accessories, for research work.

The illumination is by either a 6 volt 15 watt Köhler type illuminator, a 25 watt mains voltage illuminator or a mirror for an external source. With the Köhler type illuminator the transformer is built into the base of the instrument with a variable rheostat and a colour temperature control meter.

A very high intensity source— 100 waits at 12 volts, sufficient for projection of high power phase or polarizing images—is available from the tungsten halogen projection base, especially designed to take the M15c microscope. With this light source high colour temperatures, up to 3,300°K, can be obtained—an important advantage for colour photomicrography. The precision ball bearing

The precision ball bearing focusing slides are controlled by concentric coarse and fine

f o c u s i n g knobs, the fine control being graduated to 2 microns.

All objectives are par-focal and par-central and the higher

powers of 20X magnification and above incorporate a spring-loaded anti-crash device for specimen protection.

All the viewing heads for the M15cmicroscopeareinterchangeable and the accessories available include a photo-visual or projection trip mirror unit, which allows all the light to be deflected to the eye or alternatively to a camera or a 6 inch diameter projection screen. A magnification changer with a focusing Bertrand lens and giving magnifications of 1X, 1.5X and 2.5X can be fitted.

Focus on Ultramicrotomy

This is the second of a series presenting the LKB Ultrotome III by explaining its ability to solve problems in Ultramicrotomy.

LKB ULTROTOME III SOLVES PROBLEM OF ORIENTATION.

The grain of the structural detail of many specimens, such as fibers, films, membranes, muscle, skin and others, lies in more than one direction. Therefore this structural detail within the specimen must be located and the cutting correctly aligned to enable the best sections to be produced.

It is a great advantage to be able to produce sections either by cutting the specimen longitudinally or by making transverse cuts. The universal orientation head of the Ultrotome III used together with the vise-type specimen holder allows one and the same specimen to be adjusted in three directions perpendicular to each other without any need to loosen the specimen in the holder. Due to the gonlometer-type construction of the orientation head with its unique 45° arc displacement, the axis of the specimen block can be positioned, and rigidly fixed at angles up to 45° with respect to the axis of the specimen arm. This provides the fastest and most precise structure orientation possible without the need for any reembedding or other additional procedures.

Having all-round mobility, and a vernier scale on the arc which allows adjustments of 0.1°, the orientation head needs only one precision adjustment to enable cutting sequences in two or three directions to be carried out.

This orientation head is exclusive to the LKB Ultramicrotome LKB 8800.

Uniform High Quality and Reliability

"History in the Breaking!"

In 1950 the first glass knife for ultramicrotomy was made, by methods which were rather unconventional and did not exactly guarantee reproducibility, by breaking a bottle.

In 1964 glass was still being broken to make knives for ultramicrotomy but LKB had produced the KnifeMaker. The KnifeMaker revolutionized the production of glass knives for ultramicrotomy by making it possible to produce knives easily, quickly, with a choice of predictable edge angle, economically, and with reproducibility. Now in 1966, LKB has once again made history in breaking glass for knives, by introducing the unique Damping Device that adds even greater sensitivity (and more working edge per knife), to an instrument that has proved its reliability in ultramicrotomy laboratories and research establishments throughout the world.

Don't have a smashing time! Write today for further information on the KnifeMaker with the unique Damping Device that will give you a third more usable edge on your knives than you have ever had before!

BRITISH SOCIETY FOR CELL BIOLOGY

ANNUAL GENERAL MEETING

The Annual General Meeting of the British Society for Cell Biology will be held at the Middlesex Hospital Medical School, London, on the 4th and 5th April 1968.

There will be a Symposium entitled 'The Dynamics of Cell Membranes' followed by a session of general papers.

Further information may be obtained from the Secretary/Treasurer:

INFORMATION FOR CONTRIBUTORS

I Manuscripts should be sent to The Editors, *Journal of Cell Science*, Department of Zoology, Cambridge, England.

2 Manuscripts must be typewritten, in double spacing throughout (including tables, references and legends). Each table should be typed on a separate sheet. Legends to figures should be typed in a single series and placed at the end of the manuscript. Papers must be fully corrected by the author, and a charge will be made for excessive alteration in proof.

3 A short title of not more than 40 characters, for use as page headings, should be supplied if the full title is longer than this.

4 Manuscripts must contain a **Summary** of not more than 500 words, placed immediately after the title page. Contributors should also send three copies of an **Abstract** for distribution to abstracting journals. The abstract must be not more than 100 words long and should be headed by the author's name and address and the title of the paper. Both summary and abstract must be intelligible without reference to the main text.

5 The list of **References** must be given in alphabetical order of authors' names. The titles of journals should be abbreviated in accordance with the *World List of Scientific Periodicals*, 4th ed. (1963). The following style is used:

- BARNICOT, N. A. & HUXLEY, H. E. (1965). Electron microscope observations on mitotic chromosomes. Q. Jl microsc. Sci. 106, 197-214.
- MAZIA, D. (1961). Mitosis and the physiology of cell division. In *The Cell*, vol. 3 (ed. J. Brachet & A. E. Mirsky), pp. 77-412. New York and London: Academic Press.

Citations in the text are given in the following form: Jones & Smith (1960) or (Jones & Smith, 1960). Where there are more than two authors the first citation should include all the names and subsequent citations should be in the form (Jones *et al.* 1960). Where more than one paper by the same author(s) have been published in the same year they are cited as Jones (1960*a*), Jones (1960*b*) etc.

6 Text figures should preferably be drawn about twice final size; very large drawings should be avoided. Photographic reproductions of drawings cannot always be satisfactorily reproduced. The maximum printed size of a drawing is 5 in. by 8 in. Lettering will be inserted by the printers and should be indicated on drawings in faint blue pencil or on a tracing-paper overlay. It should be in lower case, and abbreviations should not be used if there is space for complete words.

7 Photographs should preferably be submitted the same size as they are to appear. The maximum area for a plate is $5\frac{1}{2}$ in. by $8\frac{1}{4}$ in. Where several photographs make up a plate they should be accurately mounted on one sheet of cardboard. Irregularly shaped photographs or plates should be avoided wherever possible. Lettering on plates will be inserted by the printers and should be indicated either on a duplicate, marked set of prints or on a tracingpaper overlay bearing accurately marked outlines of the objects indicated. Authors may be asked to contribute to the cost of plates in excess of four.

8 Text figures and photographs should be numbered in a single series, all text figures preceding the photographs. Each individual drawing or photograph should be numbered separately (Fig. 1, Fig. 2 and so on).

9 Where appropriate the magnifications of illustrations should be indicated by scales drawn on them. Magnifications may also be stated in the legends.

10 Authors will receive 50 offprints free of charge and may order additional copies when proofs are returned.
